In Conveyors

WHM
Equipment Co.

Your Problem-Solvers In Standard And Special Conveyor Products

WHM specializes in providing conveyors designed to meet specific requirements. We analyze your application and design a conveyor solution that is right for your operation. At WHM, we never force-fit your needs to match commercially available equipment. Instead, we provide the conveyor solutions that meet your specifications.

Customers have more options at WHM. We offer standard conveyors and the knowledge of how to apply them with the greatest efficiency. We create modified conveyor systems that incorporate standard components and custom designs. And for customer requirements that cannot be met by off-the-shelf or modified conveyor products, we engineer and build special systems from the ground up.

Standard Conveyors

Standard conveyor equipment from leading manufacturers has been an important offering of WHM since the Company's first years of serving industrial and commercial customers. Our expertise is in being able to utilize standard conveyor products and accessories to improve customer conveying processes.

While almost anyone could provide components from a catalog and even assemble them properly, it takes

experiential insight to determine optimum approaches with an eye to future expandability. WHM brings all that expertise and more to every project, large or small.

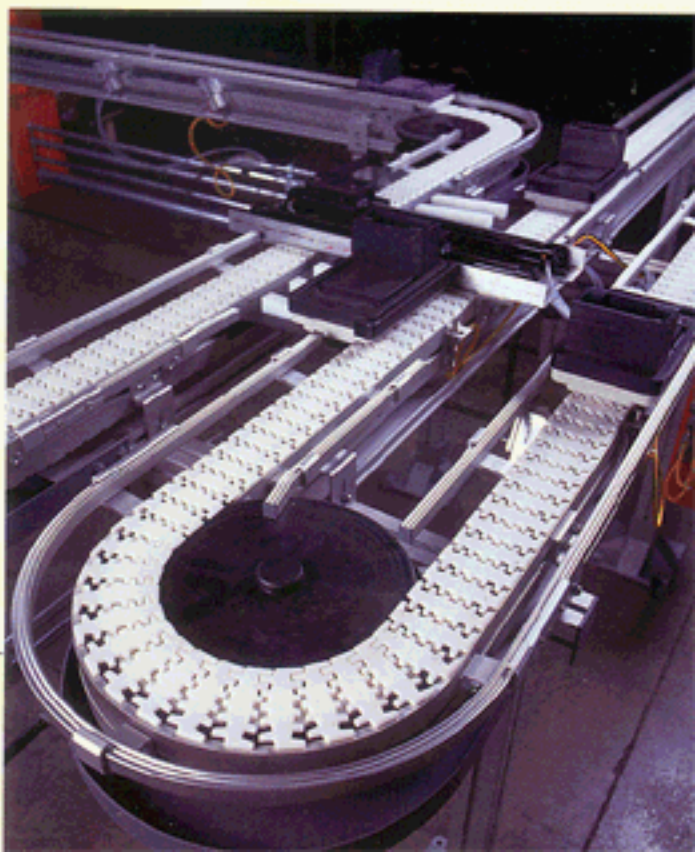

WHM offers a complete line of flexible conveyor options. These flexible designs are used by manufacturers, packagers and distribution centers to reach maximum productivity within tight space constraints.

Anti-Static Conveyors

WHM offers special designs for applications where static complicates effective processing. Anti-static conveyors are used in electronics and many other static-sensitive applications.

Pop-up "V" belt transfers move product from main line to side spurs for major appliance manufacturer

This extruded aluminum tabletop chain conveyor used by an auto manufacturer reorients pallets between precision robotic operations

Systems

With

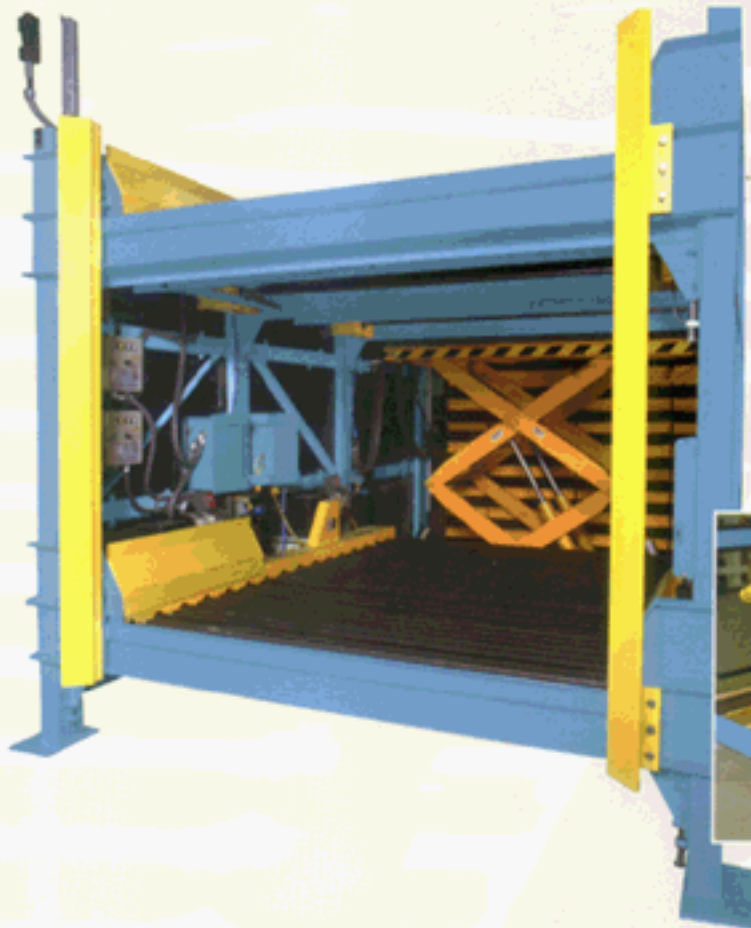

Custom

Features

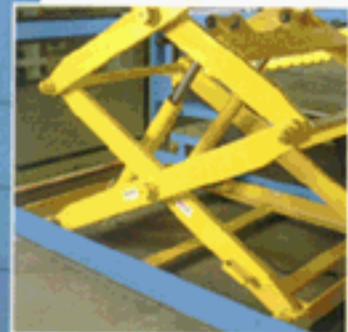

At WHM, we work with customers who need modified assembly line, process or material handling conveyors that require design and integration of standard and custom components.

These "hybrid" designs allow the user to move items

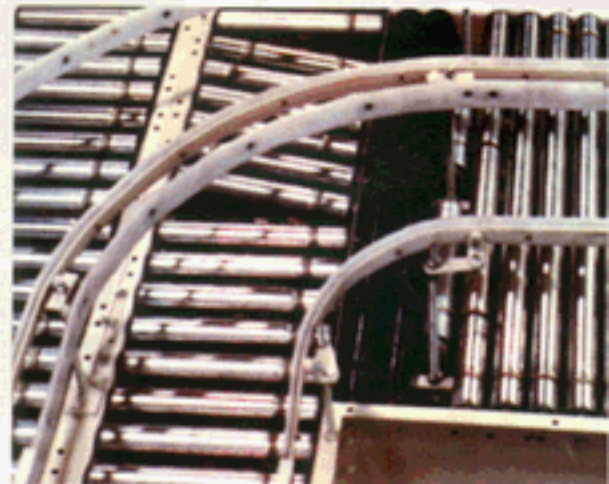

through a process in a highly defined or precise manner not attainable with standard components alone. This type of conveying can require precision start-stop, rotation and manipulation control, and other aspects of movement found in a process line.

Auto-Queue™ staging conveyors used in industrial assembly lines provide improved productivity of operator part-feeding applications while maximizing forklift efficiency. Features include heavy-duty construction, state-of-the-art controls, and low maintenance hydraulic lift, along with a variety of options

Pallets are transferred from standard conveyors to and from scale platform for weight-based filling of drums in chemical manufacturing operation

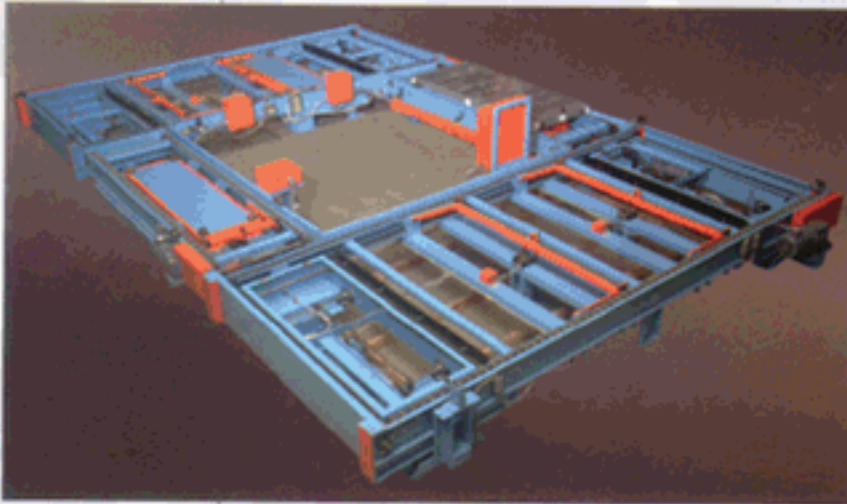

Standard line shaft transportation conveyor with custom guard rail is applied in a unique way to direct product smoothly, efficiently

Custom Conveyors

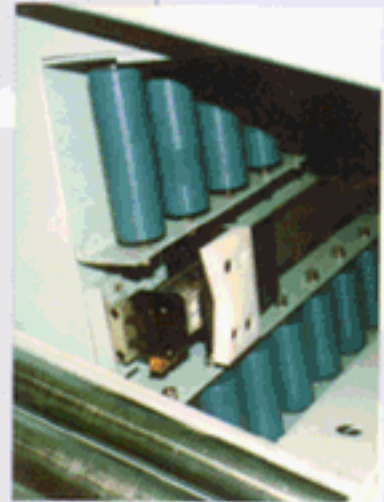

Custom conveyor equipment is built from the ground up, and is the answer when no combination of standard and modified components will meet customer process requirements. At WHM,

we design and engineer custom conveyor systems for specialized industrial applications. We use proven processes and technologies in the design of these custom systems, and apply them in innovative ways.

Standard conveyor feeds a custom up-ending mechanism in aluminum wheel finishing process

Custom-designed pallet handling system transports and accurately locates product for precision robotic welding of shelving systems

This "captive" pallet handling system (also shown on cover) moves product for in-process manufacturing of auto parts, with empty pallet return built in under the process line conveyor

WHM manufactures mobile conveyors to transport air freight containers to and from airplane cargo bays

Integrity

Our business is built on kept promises. At WHM, our approach is to build customer relationships through delivering on commitments. Our customers appreciate that approach and they show it by their repeat business.

Founded in 1968, WHM Equipment Company has developed broad, leading-edge expertise in conveyor systems used to move and manipulate product.

We work with conveyor

systems of all types, but the essence of our service to you is the ability to solve your conveying problems. Our expertise is in developing concepts that can be efficiently engineered into workable solutions to your process needs.

We achieve creative solutions because we:

- Possess expert design and technical personnel to concept and build advanced systems
- Draw components from a variety of conveyor and accessory manufacturers in building integrated systems
- Offer all the service you need, meaning we can take your project from concept to installation

Engineering Support

Both application and design engineering are available to every WHM customer. Application engineering is part of the planning process and can be done in conjunction with a needs analysis of your requirements.

Also, our engineers use Auto CAD®** systems to produce concepts and finished drawings when our customers need such support services. Our engineering department will work with your professional teams to develop solutions to your needs.

A project manager is assigned to assure that all details are executed effectively, and that the conveyor equipment or system meets specifications. They coordinate timely engineering, assembly, shipping and installation. They are your communications link, ready to find answers to any questions you may have.

Technicians With Conveyor Experience

Our mechanical and electrical technicians are specially trained in the manufacture, fabrication, assembly and installation of conveyor systems of all types. These technicians are cross-trained in many disciplines so that they have a "big-picture" appreciation of conveyors and the way in which they function.

A Creative

Culture

Based On

Experience

WHM

Services

- Conceptual design
- Design and build special conveyors
- Design and build ancillary equipment
- Design conveyor systems
- Conveyor system integration
- Project management
- Design and build electrical controls and software
- Conveyor setup and testing
- Mechanical installation
- System commissioning

Extensive manufacturing facilities allow setup and testing of many conveyor systems along with an inventory of stock components
